Oak moss extracts used in fragrance compounds must not contain added tree moss, which is a source of resin acids. Traces of resin acids may be carried over to commercial qualities of oak moss in the manufacturing process.

These traces must not exceed 0.1% (1000 ppm) dehydroabiatic acid (DHA) in the extract. The concentration of resin acids in oak moss can be measured with an HPLC Reverse Phase – spectrofluorometry method.

Further, levels of atranol and chloroatranol should each be below 100 ppm in oak moss extracts.

These indicative maximum levels should be taken into account when determining the compliance of the essential oil under its condition of use. (IFRA/IOFI Labelling Manual 2017)
